REF: SHARJAH UNIVERSITY CITY VACUUM SEWERAGE SYSTEM

In 1995 Sharjah Municipality Drainage Section ordered the first phase of the University City vacuum sewerage system from Iseki Redivac Ltd. Since then it has been necessary to extend the vacuum system on several occasions, even today the consultants acting on our behalf with the assistance of Redivac are designing further extensions to the system, these extensions are necessary due to the continued expansion of the university campus.

Iseki Redivac commenced the installation of the first 2 vacuum stations and 200 interface valve chambers early in 1995 and completed this first phase on schedule some 6 months later. We have recently commissioned phase VII of this large vacuum project and our department (SMDS) now successfully maintain and operate this vacuum system, including 4 vacuum stations, in excess of 50 kilometers of Polyethylene vacuum main and more than 500 nos. of 90 mm Iseki Redivac Interface valves.

Our experience when working with Iseki Redivac has been complementary; we are also satisfied with the quality of their interface valves and associated equipment, supplies and installation to date. Redivac have always provided a good level of technical support and always responded to our requests for assistance in a timely manner.

Yours Faithfully,
